#### **Binary Files**

#### Opening a binary file in OUTPUT mode (For writing on file)

At the time of opening the file in output mode the earlier content (if existing) gets deleted.

```
Syntax:
fstream <FileObject>;
<FileObject>.open(<FileName>,ios::binary|ios::out);

Examples:
fstream FIL;
FIL.open("STUDENT.DAT",ios::binary|ios::out);
OR
char Fname[20];
cout<<"FileName:";gets(Fname);
fstream Fil;
Fil.open(Fname,ios::binary|ios::out);</pre>
```

Opening a binary file in INPUT mode (For reading from file).

```
Syntax:
fstream <FileObject>;
<FileObject>.open(<FileName>,ios::binary|ios::in);

Examples:
fstream FIL;
FIL.open("STUDENT.DAT",ios::binary|ios::in);
OR
char Fname[20];
cout<<"Enter Filename:";gets(Fname);
fstream Fil;
Fil.open(Fname,ios::binary|ios::in);</pre>
```

#### Opening a binary file in APPEND mode (For writing on file)

At the time of opening the file in append mode the earlier content (if existing) is not over written and file write pointer moves to the end of file for adding new records at the bottom of file.

```
Syntax:
fstream <FileObject>;
<FileObject>.open(<FileName>,ios::binary|ios::app);
```

```
Examples:
fstream FIL;
FIL.open("STUDENT.DAT",ios::binary|ios::app);
OR
char Fname[20];
cout<<"Filename:";gets(Fname);
fstream Fil;
Fil.open(Fname,ios::binary|ios::app);</pre>
```

Binary files can be created in c++ with the help of variables of struct type data or objects of class.

```
class Stock
{
    int INo;
    char Item[20];float Qty;
    int INo;
    char Item[20];
    char Item[20];
    char Item[20];
    void Input()
    {cin>>INo;gets(Item);cin>>Qty;}
    void Output()
    {cout<<INo<<':'<<Item<<':'<<Qty;}
    int Rino(){return Ino;}
};</pre>
```

### Creation of a binary file with a record

```
void Create(char Fname[])
void Create(char Fname[])
 fstream Fil; Stock S;
                                                fstream Fil; Stock S;
                                                Fil.open(Fname,ios::binary|ios::out);
 Fil.open(Fname,ios::binary|ios::out);
 cout<<"Item No?";cin>>S.INo;
                                                S.Input();
 cout<<"Item
               ?";gets(S.Item);
 cout<<"Qty
                ?";cin>>S.Qty;
                                                Fil.write((char*)&S, sizeof(S));
 Fil.write((char*)&S, sizeof(S));
 Fil.close();
                                                Fil.close();
```

## Creation of a binary file with multiple records

```
void Create(char Fname[])
                                               void Create(char Fname[])
  fstream Fil; Stock S;
                                                 fstream Fil; Stock S;
 Fil.open(Fname,ios::binary|ios::out);
                                                 Fil.open(Fname,ios::binary|ios::out);
                                                 char Choice;
 char Choice;
                                                 do
    cout<<"Item No?";cin>>S.INo;
                                                   S.Input();
    cout<<"Item ?";gets(S.Item);</pre>
                  ?";cin>>S.Qty;
    cout<<"Qty
   Fil.write((char*)&S, sizeof(S));
                                                   Fil.write((char*) &S, sizeof(S));
    cout<<"More (Y/N) ?";cin>>Choice;
                                                   cout<<"More(Y/N)?";cin>>Choice;
 while (Choice=='Y');
                                                 while (Choice=='Y');
 Fil.close();
                                                 Fil.close();
```

# Displaying a record from a binary file

# Displaying the entire content (all records) from a binary file

```
void Display(char Fname[])
{
  fstream Fil; Stock S;
  Fil.open(Fname,ios::binary|ios::in);
  while(Fil.read((char*)&S,sizeof(S)))
  {
    cout<<"ItemNo:"<<S.INo<<endl;
    cout<<S.Item<<":Qty:"<<S.Qty<<endl;
  }
  Fil.close();
}</pre>
void Display(char Fname[])
{
  fstream Fil; Stock S;
  Fil.open(Fname,ios::binary|ios::in);
  while (Fil.read((char*)&S,sizeof(S)))
    S.Output();
  Fil.close();
}
```

# Displaying selected range of records from a binary file

(Record having a particular range of Item Numbers)

```
void Display(char Fname[],int NOF,int NOT)
                                              void Display(char Fname[],int NOF,int NOT)
       //NOF-Item No From & NOT-Item No To
                                                      //NOF-Item No From & NOT-Item No To
 fstream Fil; Stock S;
                                                 fstream Fil; Stock S;
 Fil.open(Fname, ios::binary|ios::in);
                                                 Fil.open(Fname, ios::binary|ios::in);
 while (Fil.read((char*) &S, sizeof(S)))
                                                 while (Fil.read((char*)&S,sizeof(S)))
   if (S.INo>=NOF && S.INo<=NOT)
                                                   if (S.Rino()>=NOF && S.Rino()<=NOT)</pre>
                                                     S.Output();
    cout<<"ItemNo:"<<S.INo<<endl;
    cout<<S.Item<<":Qty:"<<S.Qty<<endl;
 Fil.close();
                                                 Fil.close();
}
```

## Searching for a record from a binary file

```
void Display(char Fname[])
void Display(char Fname[])
 fstream Fil; Stock S;
                                                 fstream Fil; Stock S;
 int InoS, Found=0;
                                                int InoS,Found=0;
 Fil.open(Fname, ios::binary|ios::in);
                                                Fil.open(Fname, ios::binary|ios::in);
 cout<<"Enter ItemNo to search:";
                                                cout<<"Enter ItemNo to search:";
 cin>>InoS;
                                                cin>>InoS;
                                                while(Fil.read((char*)&S,sizeof(S)))
 while (Fil.read((char*) &S, sizeof(S)))
  if(S.INo==InoS)
                                                 if(S.Rino()==InoS)
     cout<<"ItemNo:"<<S.INo<<endl;
                                                  S.Output();
     cout<<S.Item<<":Qty:"<<S.Qty<<endl;
     Found++;
                                                  Found++;
  }
 if (Found==0)
                                                if (Found==0)
   cout<<"Record Not Found"<<endl;
                                                 cout<<"Record Not Found"<<endl;
 Fil.close();
                                                Fil.close();
```

### Counting no. of records in a binary file

```
int CountRecord(char Fname[])
                                               int CountRecord(char Fname[])
{
 fstream Fil; Stock S;
                                                 fstream Fil; Stock S;
 int Count=0;
                                                 int Count=0;
 Fil.open(Fname,ios::binary|ios::in);
                                                 Fil.open(Fname,ios::binary|ios::in);
 while(Fil.read((char*)&S,sizeof(S)))
                                                 while (Fil.read((char*) &S, sizeof(S)))
    Count++;
                                                   Count++;
 Fil.close();
                                                 Fil.close():
 return Count;
                                                 return Count;
```

## Transferring the content of a binary file to another

```
void Transfer(char FN1[],char FN2[])
                                              void Tranfer(char FN1[],char FN2[])
 fstream Fil1,Fil2;
                                                fstream Fil1,Fil2;
 Stock S:
                                                Stock S:
 Fill.open(FN1,ios::binary|ios::in);
                                                Fill.open(FN1,ios::binary|ios::in);
 Fil2.open(FN2,ios::binary|ios::out);
                                                Fil2.open(FN2,ios::binary|ios::out);
 while (Fill.read((char*)&S,sizeof(S)))
                                                while (Fill.read((char*)&S,sizeof(S)))
    Fil2.write((char*)&S,sizeof(S));
                                                  Fil2.write((char*)&S, sizeof(S));
 Fill.close();
                                                Fill.close();
 Fil2.close();
                                                Fil2.close();
}
                                              }
```

#### Insertion of a record in a Binary File (Sequential)

(Assuming file to be in ascending order of Item No)

```
void Insertion(char FN1[],char FN2[])
                                              void Insertion(char FN1[],char FN2[])
                                                fstream Fil1, Fil2;
 fstream Fil1,Fil2;
 Stock S, Snew;
                                                Stock S, Snew;
                                                Fill.open(FN1,ios::binary|ios::in);
 Fill.open(FN1,ios::binary|ios::in);
 Fil2.open(FN2,ios::binary|ios::out);
                                                Fil2.open(FN2,ios::binary|ios::out);
 cout<<"Enter New Record"<<endl;</pre>
                                                cout<<"Enter New Record"<<endl;
 cout<<"Item No?";cin>>Snew.INo;
                                                Snew.Input();
 cout<<"Item
               ?";gets(Snew.Item);
                ?";cin>>Snew.Qty;
 cout<<"Qty
 int Inse=0;
                                                int Inse=0:
 while (Fill.read((char*)&S,sizeof(S)))
                                                while (Fill.read((char*)&S, sizeof(S)))
    if (Snew.INo<S.INo && !Inse)
                                                  if (Snew.Rino() <S.RINo() && !Inse)
    Fil2.write((char*)&Snew,sizeof(Snew));
                                                  Fil2.write((char*)&Snew,sizeof(Snew));
    Fil2.write((char*)&S,sizeof(S));
                                                  Fil2.write((char*)&S, sizeof(S));
                                                if (!Inse)
   Fil2.write((char*)&Snew,sizeof(Snew));
                                                  Fil2.write((char*)&Snew,sizeof(Snew));
 Fill.close():
                                                Fill.close():
 Fil2.close();
                                                Fil2.close();
```

#### Deletion of a record from binary file

```
void Deletion(char FN1[],char FN2[])
                                               void Deletion(char FN1[],char FN2[])
 fstream Fil1,Fil2;
                                                 fstream Fil1,Fil2;
 Stock S;
                                                 Stock S;
 int InoD;//Itemno to be deleted
                                                 int InoD; //Itemno to be deleted
 Fill.open(FN1,ios::binary|ios::in);
                                                 Fill.open(FN1,ios::binary|ios::in);
 Fil2.open(FN2,ios::binary|ios::out);
                                                 Fil2.open(FN2,ios::binary|ios::out);
 cout<<"Enter ItemNo to be deleted:";
                                                 cout<<"Enter ItemNo to be deleted:";
 cout<<"Item No?";cin>>InoD;
                                                 cout<<"Item No?";cin>>InoD;
 int Dele=0;
                                                 int Dele=0;
 while (Fill.read((char*)&S,sizeof(S)))
                                                 while (Fill.read((char*)&S, sizeof(S)))
    if (S.INo!=InoD)
                                                   if (S.Rino()!=InoD)
     Fil2.write((char*)&S, sizeof(S));
                                                     Fil2.write((char*)&S, sizeof(S));
                                                   else
    else
     Dele++;
                                                     Dele++;

                                                   cout<<"Record deleted..."<<endl;
 Fill.close();
                                                 Fil1.close();
 Fil2.close();
                                                 Fil2.close();
```

## Adding a record at the end of an existing binary file

```
void Create(char Fname[])
                                              void Create(char Fname[])
 fstream Fil; Stock S;
                                                fstream Fil; Stock S;
 Fil.open(Fname,ios::binary|ios::app);
                                                Fil.open(Fname, ios::binary|ios::app);
 cout<<"Item No?";cin>>S.INo;
                                                S.Input();
 cout<<"Item
               ?";gets(S.Item);
                ?";cin>>S.Qty;
 cout<<"Qty
 Fil.write((char*)&S, sizeof(S));
                                                Fil.write((char*)&S, sizeof(S));
 Fil.close();
                                                Fil.close();
```

```
#include <fstream.h>
#include <conio.h>
#include <stdio.h>
#include <string.h>
#include <ctype.h>
class EMP

```

## To sort a binary file in ascending order of Eno (Numeric Field)

```
void SortEno()
{
  fstream F;
 F.open("EMP.DAT",ios::binary|ios::in|ios::out);
  //Move to the last record
  F.seekg(0,ios::end);
                                     //To move the record pointer to end of file
  int NOR=F.tellq()/sizeof(EMP); //To find number of records in the file
 EMP EJ,EJP1;
  for (int i=0;i<NOR-1;i++)</pre>
    for (int j=0;j<NOR-i-1;j++)</pre>
      F.seekg(j*sizeof(EMP));
                                     //To move the file pointer to jth position
                                          //reads jth record
      F.read((char*) &EJ, sizeof(EMP));
      F.read((char*)&EJP1,sizeof(EMP)); //reads (j+1)th record
      if (EJ.GetEno()>EJP1.GetEno())
       F.seekp(j*sizeof(EMP));
       F.write((char*) &EJP1, sizeof(EMP));
       F.write((char*) &EJ, sizeof(EMP));
      }
    }
  F.close();
}
```

# To sort a binary file in ascending order of Ename (String)

```
void SortEname()
 fstream F;
 F.open("EMP.DAT",ios::binary|ios::in|ios::out);
                                //To move the record pointer to end of file
 F.seekg(0,ios::end);
 int NOR=F.tellg()/sizeof(EMP);//To find number of records in the file
 EMP EJ,EJP1;
 for (int i=0;i<NOR-1;i++)</pre>

```

**Syntax** 

#### Functions/Keywords associated with File Handling in C++ A **keyword** used in C++, which returns the no. of bytes required by a particular variable/object or a sizeof data type. Example int A; float B; char T, P[25]; cout<<sizeof(A);//will display 2</pre> cout<<sizeof(B);//will display 4</pre> cout<<sizeof(T);//will display 1</pre> cout<<sizeof(P);//will display 25</pre> A member function of fstream, ifstream and ofstream used to open a file object in a particular <u>open</u> Header File <fstream.h> **Syntax** <fstream object>.open(<char\*- Filename>,<int- Filemode>); Example fstream Fil; Fil.open("STDNT.DAT",ios::binary|ios::in); A member function of fstream, ifstream and ofstream used to close a file object. close Header File <fstream.h> Syntax: <fstream object>.close(); Example fstream Fil; Fil.open("STDNT.DAT", ios::binary|ios::in); Fil.close(); A member function of istream/ifstream/fstream, used to extract a no. of characters. read Header Files <iostream.h> and <fstream.h> **Syntax** <fstream object>.read(<char\*>,<int>); Example fstream Fil; Student S; Fil.open("STDNT.DAT", ios::binary|ios::in); Fil.read((char\*)&S, sizeof(S)); S.Output(); A member function of ostream/ofstream, used to insert a no. of characters. write Header Files <iostream.h> and <fstream.h> Syntax <fstream object>.write(<char\*>,<int>); Example fstream Fil; Student S; Fil.open("STDNT.DAT", ios::binary|ios::out); S.Input(); Fil.write((char\*)&S, sizeof(S)); Fil.close(); A member function of ios, returns a non-zero value at the end of file. <u>eof</u> Header Files <iostream.h> and <fstream.h> **Syntax** eof(<fstream object>) Example fstream Fil; Student S; Fil.open("STDNT.DAT", ios::binary|ios::in); Fil.read((char\*) &S, sizeof(S)); if (!Fil.eof()) S.Output(); Fil.close(); A member function of istream/ifstream/fstream, used to extract next character/eof. <u>aet</u> Header Files <iostream.h> and <fstream.h>

```

                                                                                                       #8
```

<ifstream/istream object>.get();

Example

```
ifstream Fil("LETTER.MYN"); char ch;
                    ch=Fil.get();
                    while (!Fil.eof())
                      cout << ch;
                      ch=Fil.get();
                    Fil.close();
             A member function of ostream/ofstream, used to insert a character.
<u>put</u>
             Header Files <iostream.h> and <fstream.h>
             Syntax
                    <ofstream/ostream object>.put(<char>);
             Example
                    ofstream Fil ("LETTER.MYN"); char ch;
                    do
                      ch=getche();
                      if (ch!=27) Fil.put(ch);
                    while (ch!=27);
                    Fil.close();
getline
             A member function of istream, used to extract characters upto the size given/upto the delimeter
             whichever encountered first.
             Header Files <iostream.h> and <fstream.h>
             Syntax
                    <istream/ifstream object>.getline(<char*>,<int>);
                    <istream/ifstream object>.getline(<char*>,<int>,<char>);
             Example
                    ifstream Fil; char Str[80];
                    Fil.getline(Str,80);
                    while (!Fil.eof())
                      cout<<Str<<endl;
                      Fil.getline(Str,80);
                    Fil.close();
tellq
             A member function of ifstream, used to return the current byte position in a binary file.
             Header Files <fstream.h>
             Syntax
                    int <ifstream object>.tellg();
             Example
                    fstream Fil; Fil.open("EMP.DAT", ios::binary|ios::in);
                    EMP E;
                    Fil.read((char*)&E, sizeof(E));//Reading first record
                    Fil.read((char*)&E,sizeof(E));//Reading second record
                    int N=Fil.tellg()/sizeof(EMP);
                    cout<<"Record Number:"<<N<<endl;</pre>
                    Fil.close();
             A member function of ofstream, used to return the current byte position in a binary file.
tellp
             Header Files <fstream.h>
             Syntax
                    int <ifstream object>.tellp();
             Example
                    fstream Fil;
                    Fil.open("EMP.DAT",ios::binary|ios::in|ios::out);
                    EMP E,F;
                    Fil.read((char*)&E, sizeof(E));//Reading first record
                    F.Input();
```

File Handling in C++ By Mukesh Kumar

#9

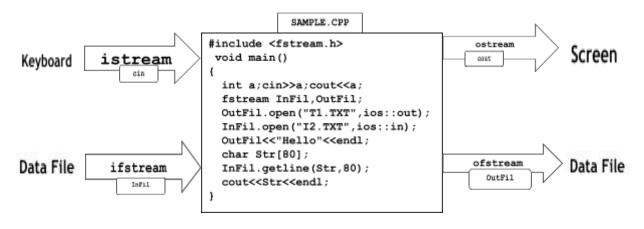

```
Fil.write((char*)&F, sizeof(F));//Writing second record
                    int N=Fil.tellp()/sizeof(EMP);
                    cout<<"Record Number:"<<N<<endl;</pre>
                    Fil.close();
             A member function of ifstream, used to move the file pointer to a specified byte position in a
seeka
             Header Files <fstream.h>
             Syntax
                    <ifstream object>.seekg(<Byte Position>);
             Example
                     fstream Fil; Fil.open("EMP.DAT", ios::binary|ios::in);
                    Fil.seekg(3*sizeof(EMP));//Moves the file pointer to 4th record
                    Fil.read((char*)&E, sizeof(E));//Reading 4<sup>th</sup> record
                    E.Display();
                    Fil.close();
             A member function of ofstream, used to move the file pointer to a specified byte position in a
<u>seekp</u>
             binary file.
             Header Files <fstream.h>
             Syntax
                     <ofstream object>.seekp(<Byte Position>);
             Example
                     fstream Fil;
                    Fil.open("EMP.DAT",ios::binary|ios::in|ios::out);
                    EMP E;
                    E.Input();
                    Fil.seekp(3*sizeof(EMP));//Moves the file pointer to 4th record
                    Fil.write((char*)&E,sizeof(E));//Writing 4<sup>th</sup> record
```

#### **Streams**

Fil.close();

A stream is used to manage flow of bytes. An input stream (istream) manages bytes flowing into the program, and an output stream (ostream) manages bytes flowing out of the program. Instance (object) of the class istream (cin) represents the standard input device (i.e. the keyboard). Instance (object) of the class ostream (cout) manages the output of data from the program to the standard output device (i.e. screen/monitor).

In C++, a data file is simply an external stream (a sequence of bytes stored on a disk). If a file is opened for output (for writing on to the file), then it is an output file stream (ofstream). If the file is opened for input (for reading from file), then it is an input file stream (ifstream).

#### **Sample Questions (as per CBSE Board Examination Papers)**

1. "SHOW.DAT" is a binary file containing objects of a class PLAY. The class PLAY is defined as follows:

```
class PLAY
{
     char PlayTitle[20];
     int Duration;//Assuming duration in hours
public:
     void NewPlay() {gets(PlayTitle);cin>>Dur;}
     void PlayList() {cout<<PlayTitle<<'':'<<Duration<<end1;}
     int DurationLook(int Dur) {return (Dur==Duration)?1:0;}
};</pre>
```

Write a function in C++ to read the content from "SHOW.DAT" and display those Titles of those whose duration is 3 hours.

- 2. Assuming a binary file STOCK.DAT containing objects of class STOCK, write functions in C++ to perform the following:
  - (i) To get the data values for objects of STOCK from the user and write them into the binary file.
  - (ii) To read the objects of STOCK from the binary file and display them on screen.

```
class STOCK
{
    int ITNO;
    char ITEM[10];
public:
    void GETIT(){cin>>ITNO;gets(ITEM);}
    void SHOWIT(){cout<<ITNO<<" "<<ITEM<<endl;}
};</pre>
```

- 3. Assuming the class DRINKS defined below; write functions in C++ to perform the following:
  - (i) To get the data values for objects of DRINKS from the user and write them into a binary file "DRINKS.DAT".
  - (ii) To read the objects of DRINKS from "DRINKS.DAT" and display the detail the detail of drink, where the name is "INDY COLA".

4. Consider the following class definition

```
class EMPLOYEE
{
   int Code;
   char Name[20];
   float Salary;
public:
   void Input() {cin>>code>>name>>salary;}
   void Show() {cout<<code<<name<<salary<<endl;}
   float Retsal() {return salary;}
};</pre>
```

Write functions in C++

- i) To get the data values for objects of **EMPLOYEE** from the user and write the objects of **EMPLOYEE** to a binary file "EMP.DAT".
- ii) To read the objects of **EMPLOYEE** from binary file "EMP.DAT" and display all the objects on the screen where salary is between Rs. 10000 and Rs. 20000.
- 5. Consider the following class definition

```
class Bank
{
   int Accno;
   char Name[20];
   float Balance;
public:
   void Input() {cin>>accno>>name>>balance;}
   void Display() {cout<<accno<<name<<balance<<endl;}
   float Getbalance() {return balance;}
};</pre>
```

Write functions in C++

- i) To accept the objects of class Bank from the user and write to a binary file "BANK.DAT".
- ii) To read the objects of **Bank** from binary file and display all the objects on the screen where balance is more than Rs. 25000.
- 6. A binary file "BOOK.DAT" is containing objects of class LIBRARY, which is defined as follows:

```
class LIBRARY
{
        char Title[20], Subject[20];
public:
        void Display() {cout<<Title<<"\rightarrow"<<Subject<<endl;
        int CheckTitle(char T[]) {strcmp(T,Title);}
};</pre>
```

Write a function in C++ to search for the Title of a book desired by the user from the binary file "BOOK.DAT" and display Title and Subject, if the Title of book is present in the file.

7. A binary file "DRUG.DAT" is containing objects of class MEDICAL which is defined as follows:

```
class MEDICAL
{
      char Drug[20], Disease[20];
public:
      void Display() {cout<<Drug<<"\rightarrow"<<Disease<<endl;
      int CheckDrug(char Dname[]) {strcmp(Drug,DrugName);}
};</pre>
```

Write a function in C++ to search for a name of the medicine (Drug) from the binary file "DRUG.DAT" and display Drug and Disease if the medicine is present in the file.

- 8. Write a program in C++ to perform the following operations related to text file:
  - To create a text file "STORY.TXT" from the content typed by the user.
  - To display the content of "STORY.TXT" on screen
  - To display and count the number of alphabets present in the file "STORY.TXT"
